***Allowable Subject Matter***

1. This office action is in response to the amendment filed on 12/06/04.
2. Claims 1-35, 37-38 are allowed.
3. The following is a statement of reasons for the indication of allowable subject matter:

Applicants have cancelled claim 36 in accordance with the office action dated 09/21/04. The present invention relates to impulse radio system. Prior art of record, upon further consideration, fails to fairly teaches method and apparatus for improving signals quality in an impulse radio system, as claimed, including "transmitting a pulse train signal having pulses positioned in time in accordance with code elements of a first code; receiving the pulse train signal in accordance with code elements of a second code, wherein the code elements of the second code comprise the code elements of the first code and additional code elements" in independent claim 31 (claims 32-34 depend therefrom); "producing a first code having a plurality of code elements that specify a position in time of a plurality of pulses in accordance with a layout; and producing a second code having at least one additional code element from said first code wherein the at least one additional code element specifies an interference sample time in accordance with the layout" in independent claim 35; "transmitting a pulse train signal having pulses positioned in time in accordance with code elements of a first code; receiving a subset of the pulse train signal in accordance with code elements of a second code, wherein the code elements of the second code comprise a subset of the code elements of the first code" in independent claim 37; "transmitting a pulse train

signal having pulses positioned in time in accordance with code elements of a first code; receiving the pulse train signal in accordance with code elements of the first code; measuring interference samples at times specified by code elements of a second code to remove interference from the received pulse train” in independent claim 38 and “recovering a received pulse train signal in accordance with the arrival time of the at least one pulse; measuring one or more interference samples at one or more interference sample times that do not coincide with an arrival time; modifying the received pulse train signal in accordance with a measured interference sample; and varying at least one of said one or more interference sample times until one or more received signal quality measures satisfy a predefined signal quality criterion” in independent claim 1 (claims 2-30 depend therefrom). Thus, claims 1-35, 37-38 are found to be novel and unobvious over prior art of record.
